

Start small. Make it useful.

Your first smart home device: a five-step checklist.

One room. One everyday problem. One thoughtful purchase.

☐ 1. Choose one job

Write down what you want to make easier: lighting a room, checking the front door or controlling one appliance. Start with a device that solves that job.

☐ 2. Check the fit

Confirm the exact model, regional voltage, bulb fitting or door measurements. Check phone compatibility, Wi-Fi requirements and any required hub.

☐ 3. Count the complete cost

Include accessories, batteries, storage, subscriptions and hubs. Compare the full setup and check the seller, return terms and warranty before buying.

☐ 4. Set it up carefully

Follow the manufacturer instructions. Install available updates, use a unique account password, and review access permissions and recording settings where relevant.

☐ 5. Test one useful routine

Try one simple schedule or action. Check manual controls and what happens when the internet is unavailable. Keep the instructions and backup-access details handy.

Compare before you buy
